

Surface Treatment

Surface treatment applications provide an all-weather, skid-resistant wearing surface and waterproof barrier for underlying materials.

A cost-effective way to ensure durable, long-lasting riding surfaces.

Great for rural and urban applications, surface treatment converts gravel roads or preserves those that have an existing surface treatment.

FEATURES & BENEFITS

- Cost effective solution for roads with low-to-medium volume traffic
- Preserves weathered pavements
- Saves time and money by reducing or eliminating the need for reconstruction
- Experienced personnel, state-of-the-art equipment, high quality materials and meticulous workmanship
- Meets OPSS specifications

Surface Treatment

Walker has been a leader in surface treatment applications for over 45 years. We've got it down to a science.

Quality surface treatment applications require precision and efficiency. Our skilled professionals understand how materials interact with each other under any traffic and weather conditions. Walker will assess current road conditions to determine if additional granular stone is required to build up areas of the road prior to applying the surface treatment.

Surface treatment includes a layer of asphalt emulsion sprayed onto a prepared base, followed by an application of aggregate set in place using rollers. Single, double or triple applications of the process can be repeated.

Our team can help determine the best application and assist in the custom design and mix of emulsion and aggregate. This expertise combined with advanced distribution equipment and asphalt emulsion technology will ensure your project's success.
